

Appendix 9.4 - Modelled Results Using 2015 Verification

This appendix outlines the impact of the Proposed Development in a scenario in which the model was verified on 2015 data, as opposed to 2016 data. NBC monitoring data highlighted a consistent and unexplained increase in annual mean NO₂ concentrations across the town in 2016, which was inconsistent with the general trend of improving air quality seen between 2012 and 2015.

Table A9.4.1: Impact of Proposed Development on Annual Mean NO₂ Concentrations (µg.m⁻³) (2021)

The data in the above tables re-enforce the conclusion that significant impacts are to be expected at isolated dwellings due to the operation of the Proposed Development. However, it shows that the overall significance of the Proposed Development in each study area is lesser. In this sensitivity test, the overall impact of the Proposed Development on NO₂ and PM₁₀ in each study area is considered **Negligible**.
